Elastic-Stack

Elastic | Security:

Discover Getting started with Kibana

In this lesson...

I will

- Navigate to the Discover app
- Learn basic features of the Discover app

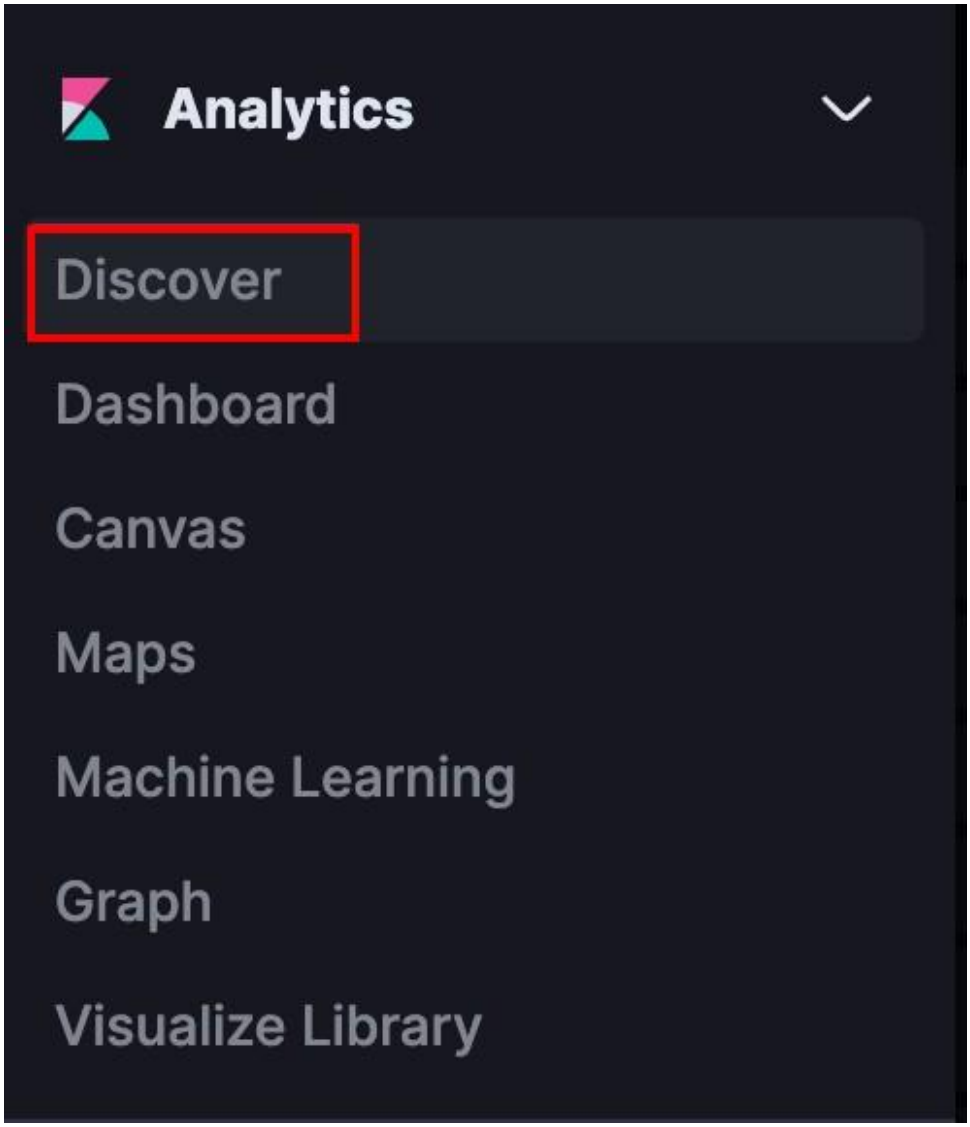

Navigating the Discover app

1. Navigate to **Discover**.

Term: Discover app

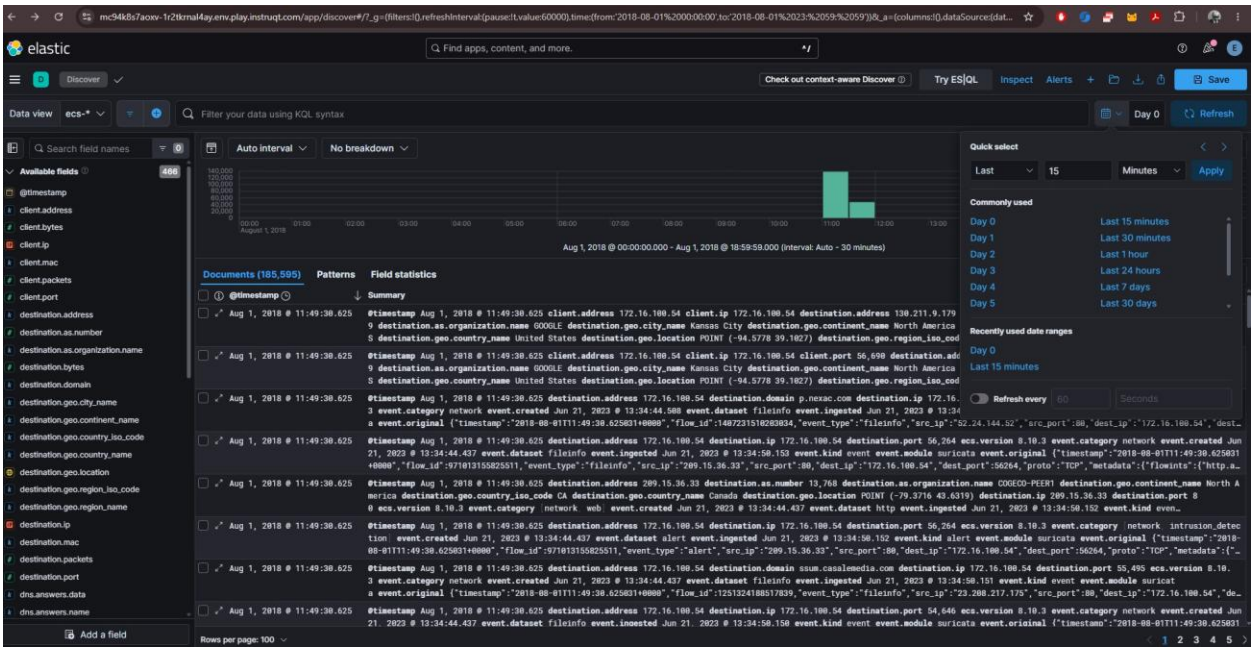

The **Discover app** is Kibana's most basic way to view data stored in your Elastic stack

1-1. Select the **Discover** button under **Analytics** in Kibana.

Adjust the **Time Picker**.

2-1. Adjust the time picker by selecting the Calendar

Observe the available **Data view**.

Term: Data view

Data view is a way to define which indices are being viewed

Term: Indices

Indices/Index are a group of documents, usually grouped by what created the document and when the documents were created (ex. 1 day of Zeek data would make an index named ecs-zeek-2025-12-2)

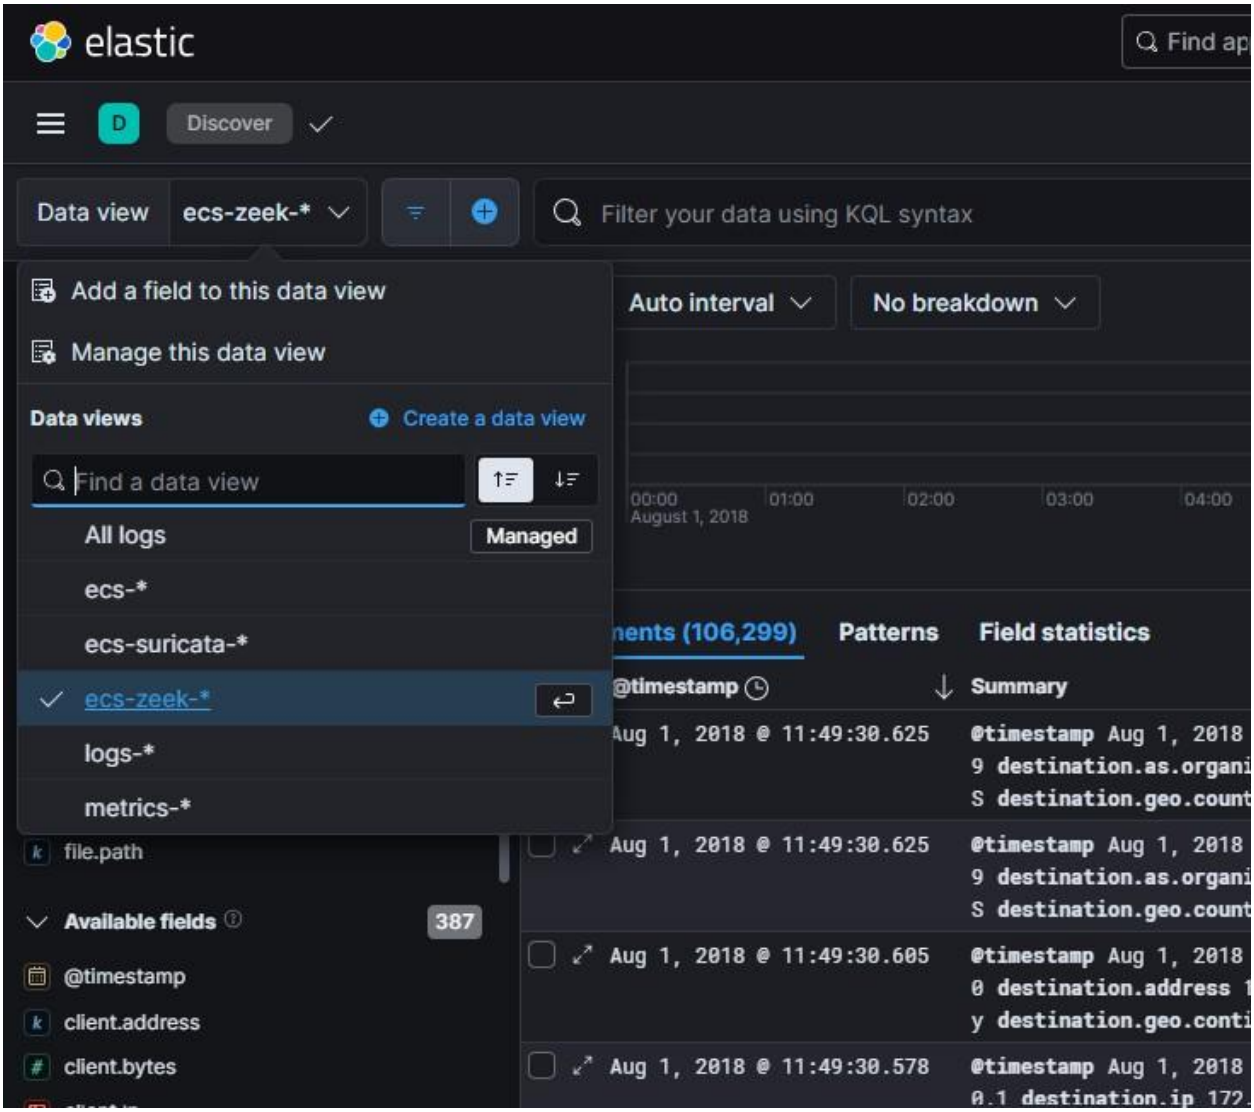

Term: Document

A **Document** is a single log event that contains multiple fields (ex. a Windows authentication event will create 1 document)

Term: Field

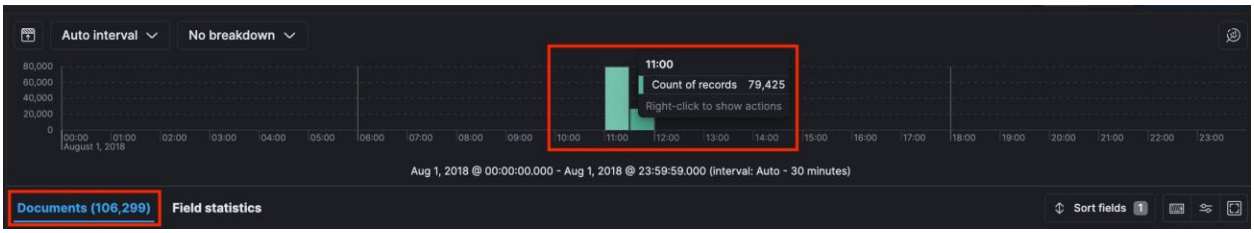

A **Field** is a single piece of information that makes up a document (ex. `source.ip`

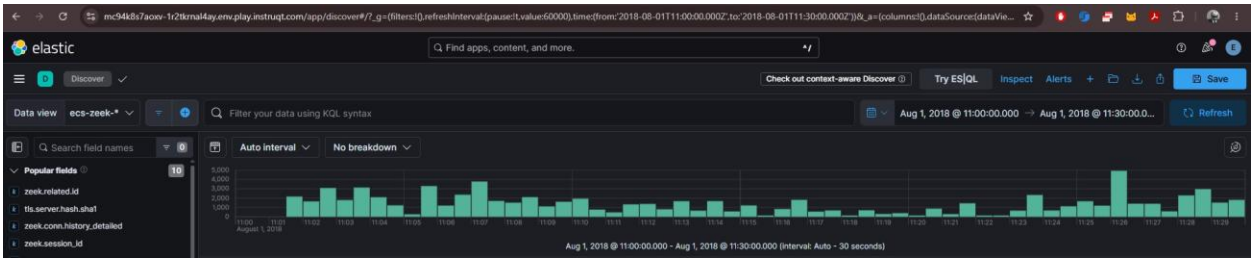

3-1. Select the **Data view** dropdown to observe which data views are available and select `ecs-zeek-*`.

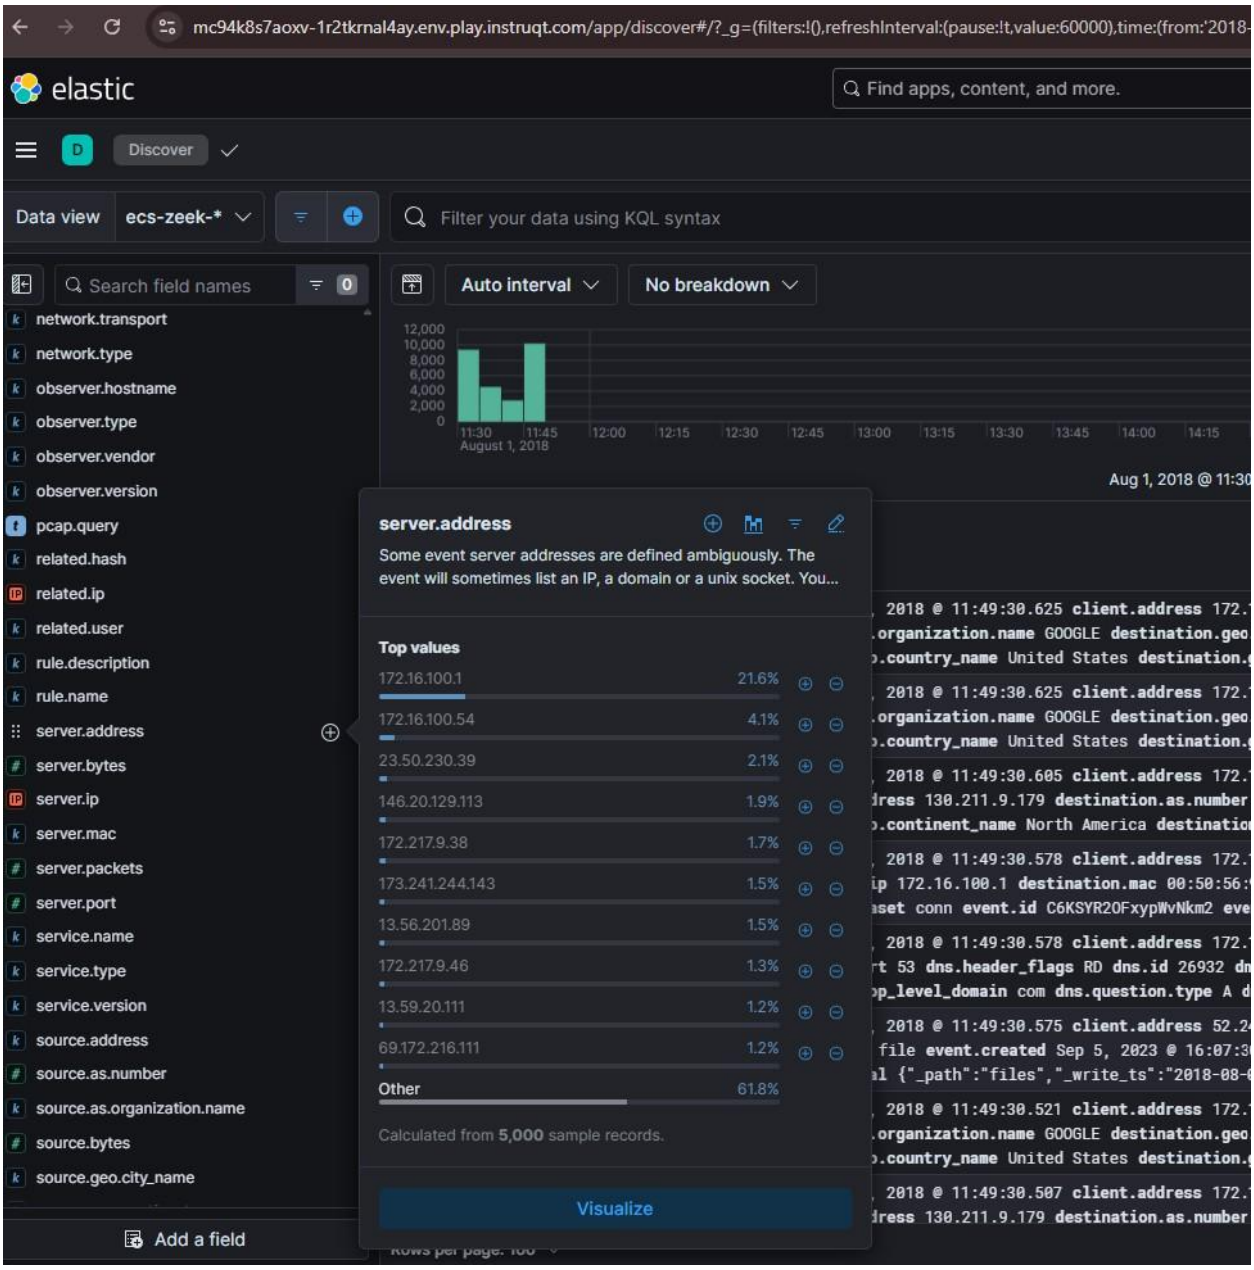

Review document results via built-in histogram.

4-1. Observe the number of total hits on the documents tab. Hover your cursor over the largest green bar to see the document count for the first time bucket in the histogram. Click on the largest green bar.

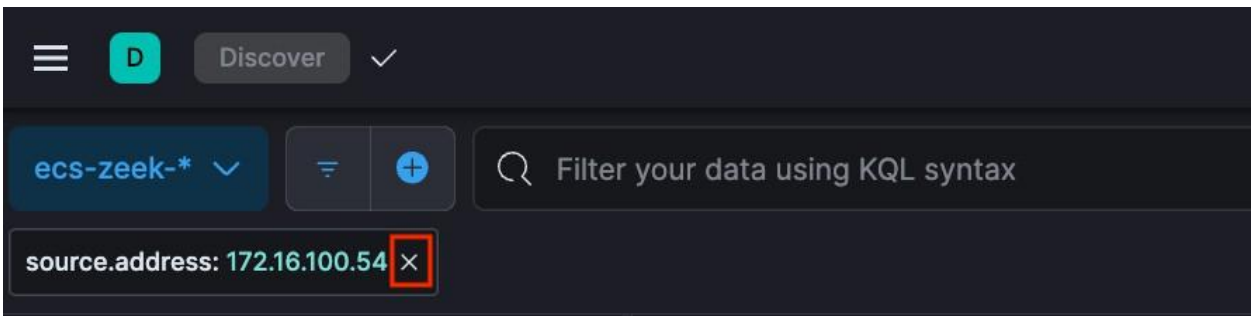

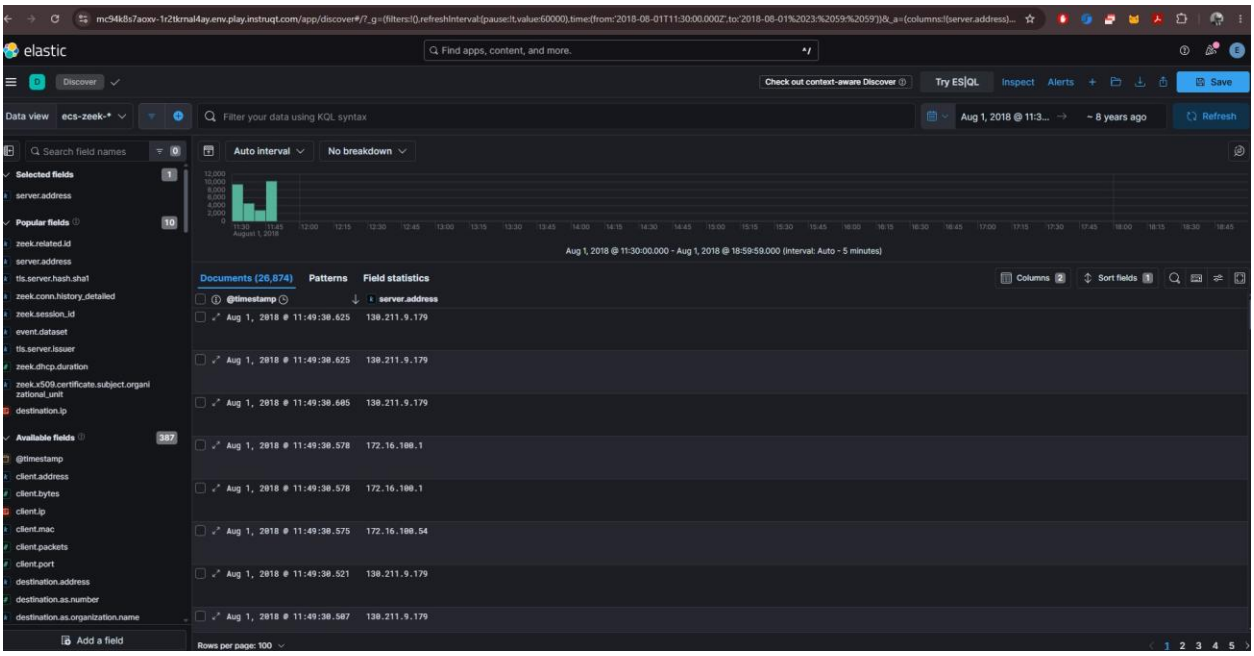

1-2. To create a filter from the **Available Fields** list, select the name of any field to get a preview of the top 10 results. These results are calculated based on 5,000 sample records from the data view. In this example, we will use `source.address`. Select the plus sign (**+**) next to one of the values to filter for it. Your filter will now appear under the query bar. To remove this filter, select the **X**.

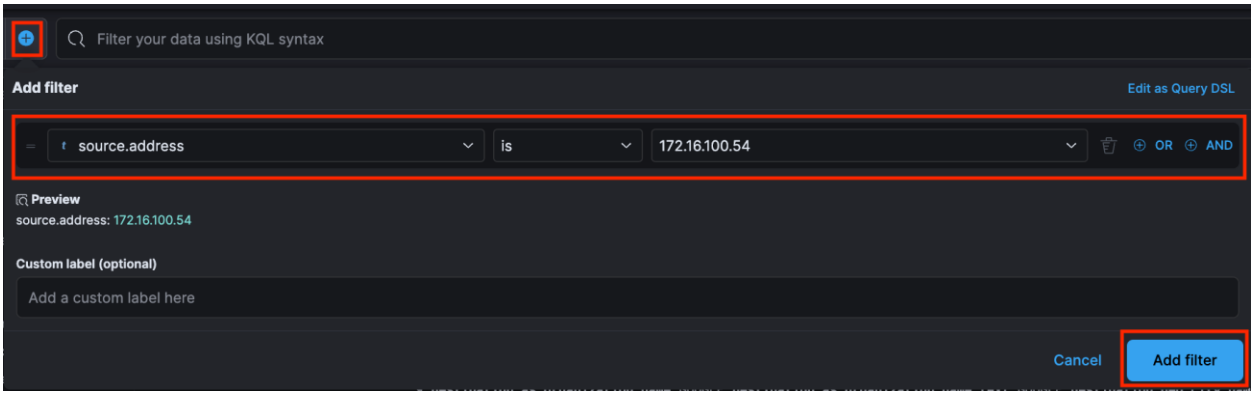

Your filter will now appear under the query bar. To remove this filter, select the **X**.

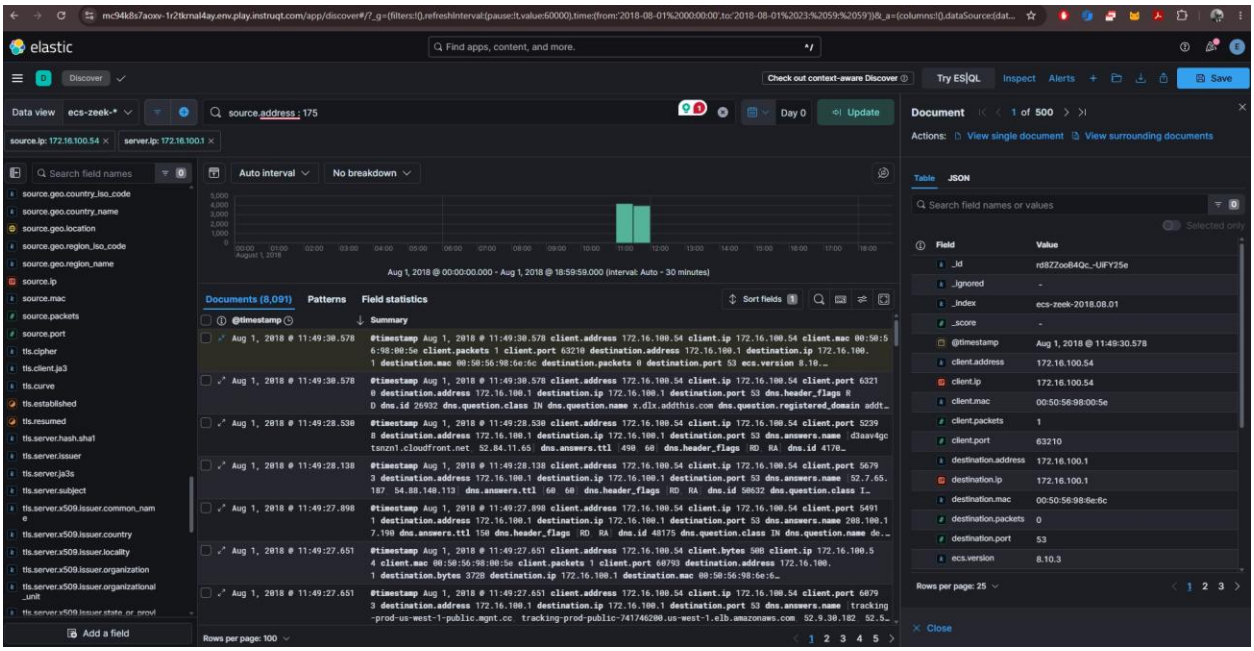

1-3. Let's create this filter in a different way. Select (**+**). Then select a field in the field drop-down menu. Next, select the **is** operator, and an available value. Finally, select **Add Filter**. This new filter will produce the same results as the one created in step 1-1.

Inspect individual documents from the filtered results.

2-1. Expand one of the documents in the document table by selecting the arrow at the left of its row.

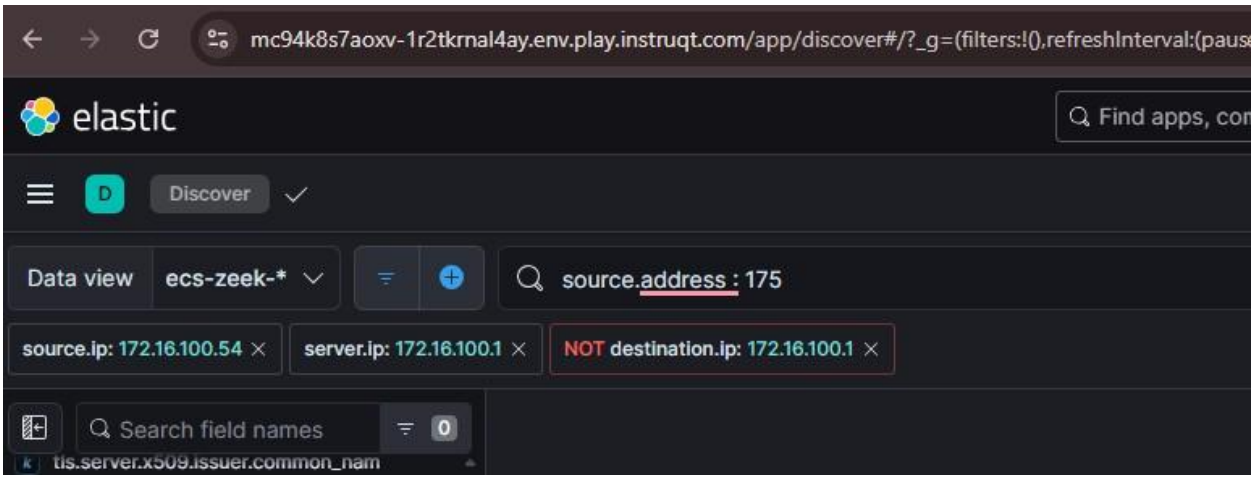

2-2. Observe the fields and value data associated with this document and hover over the **Value** column to view the options available.

2-3. Choose an interesting field, and select the minus sign (**-**) while hovering over the value to filter the value out. This will exclude all results that match the filter.

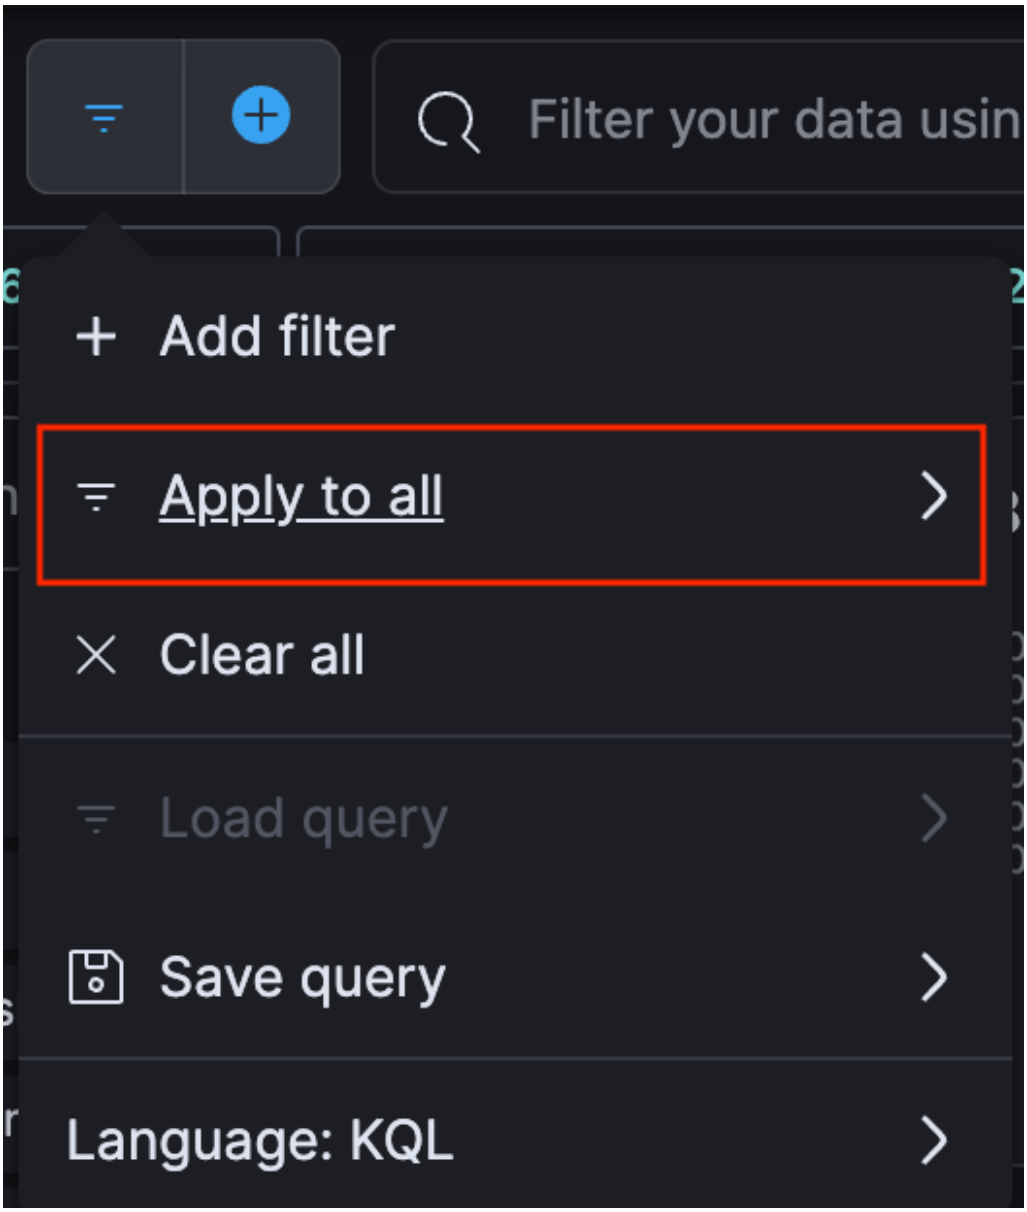

Leverage the query menu to apply different filter options.

3-1. You should now have two filters applied. Select the query menu button above the filters.

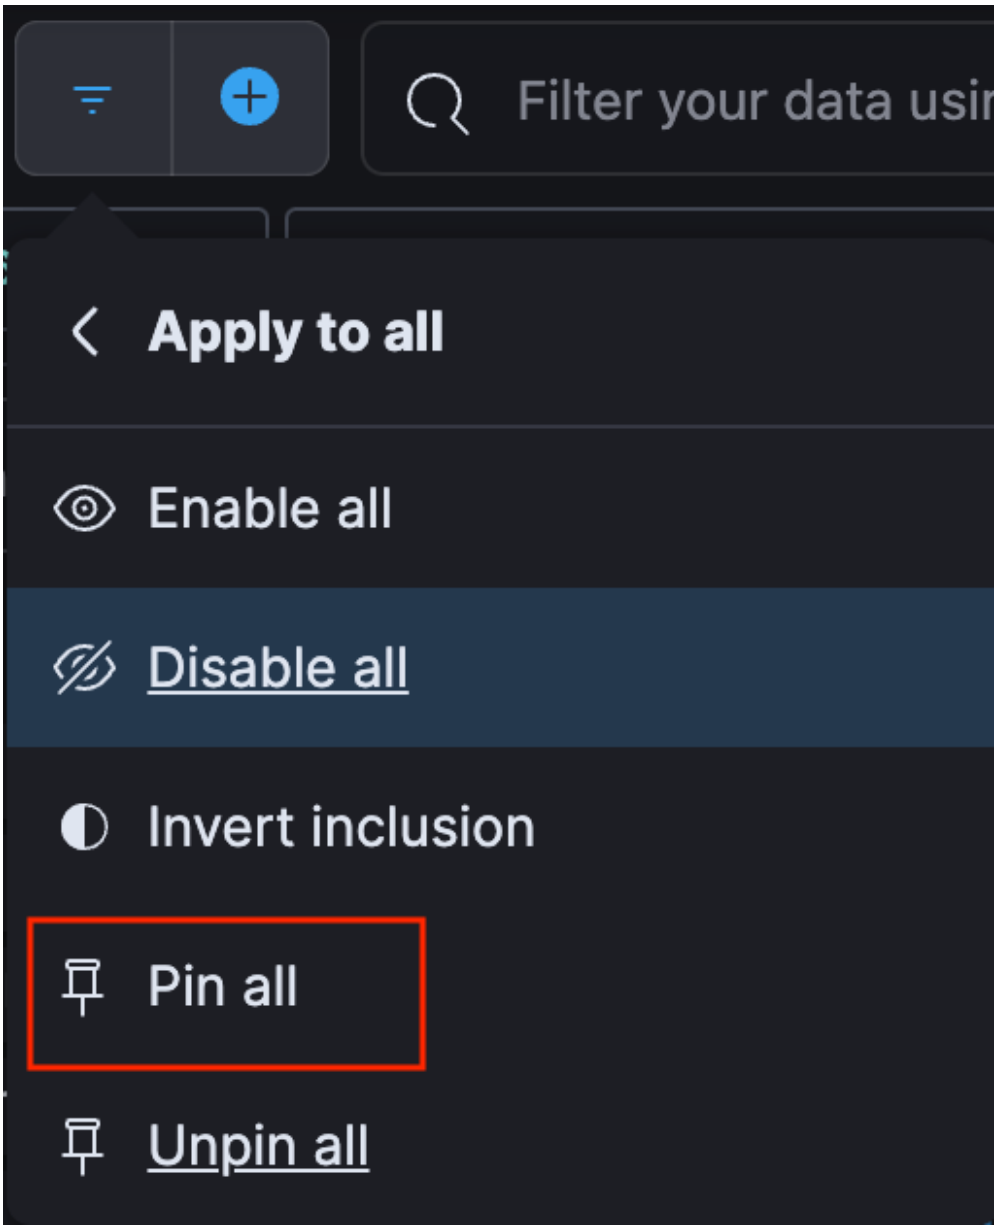

3-2. Select **Apply to all** to view changes that can be applied to every filter simultaneously.

The options available are:

- **Enable all** - Enable any disabled filters.
- **Disable all** - Disable any enabled filters.
- **Invert inclusion** - Invert the inclusion/exclusion of all filters.
- **Pin all** - All filters will stay in your filter bar and be applied to any Dashboards, Visualizations, etc., that you navigate to until unpinned.
- **Unpin all** - All filters will be unpinned from the filter bar.

The example below would **Pin all** filters across apps in Kibana.

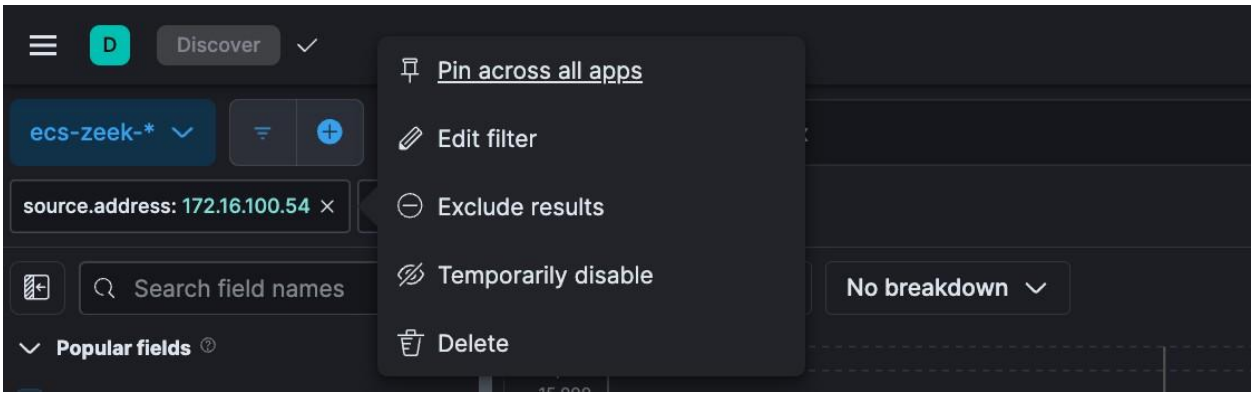

Observe the options available for individual filters.

4-1. Select one of the filters to observe the options available.

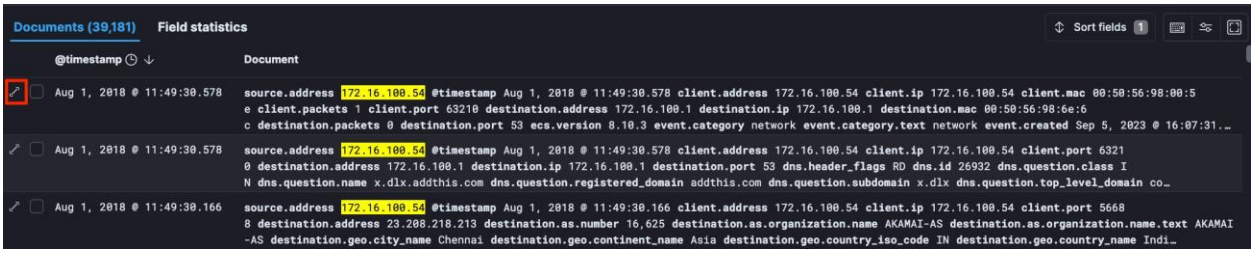

- **Pin across all apps** - Filters will stay in your filter bar and be applied to any Dashboards, Visualizations, etc., that you navigate to until unpinned.

- **Edit filter** - Change filter, operators, value, add additional filters, and custom labels.
- **Exclude results/Include results** - Exclude or invert the filter from search results.
- **Temporarily disable/Re-enable** - Disable or re-enable filters.
- **Delete** - Remove the filter.

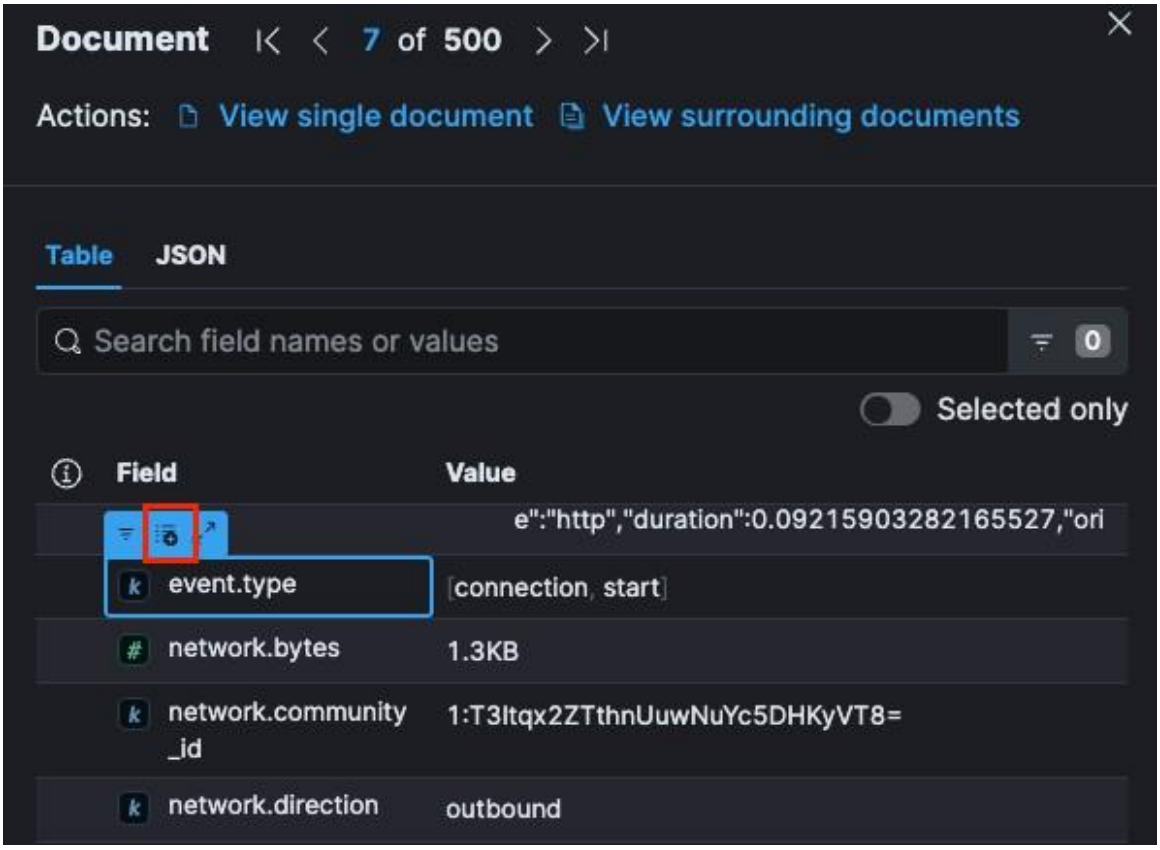

Inspect a new document with the new filters applied.

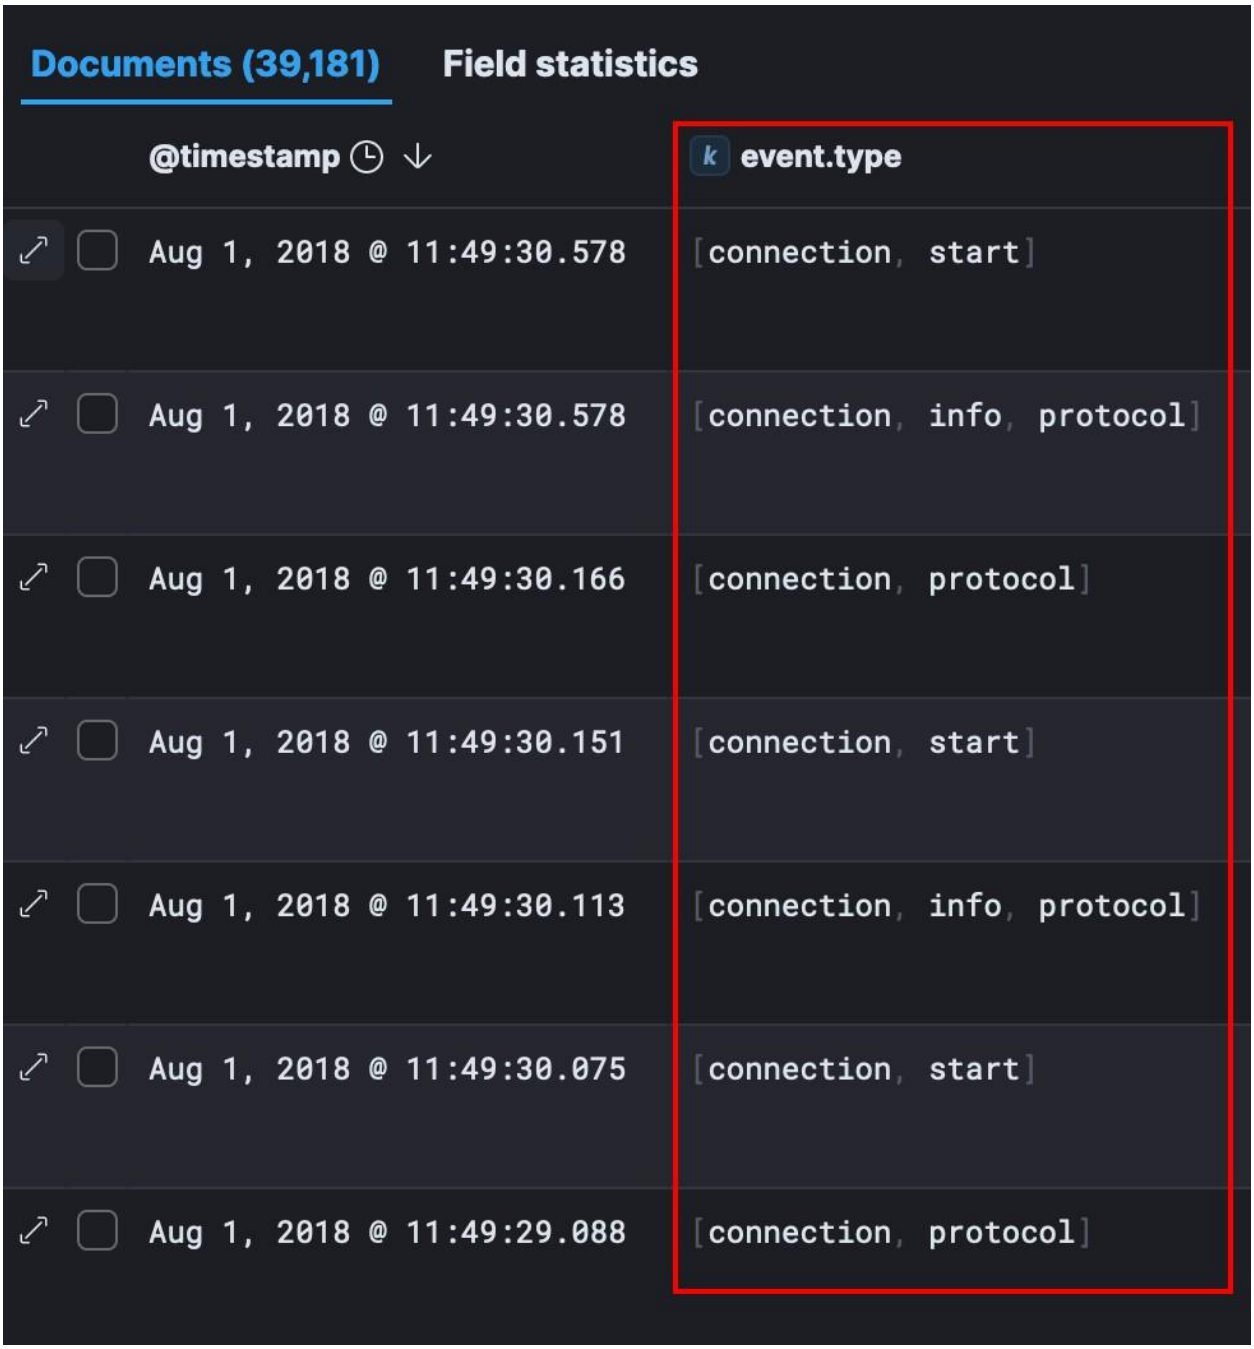

5-1. Expand a new document from the updated results.

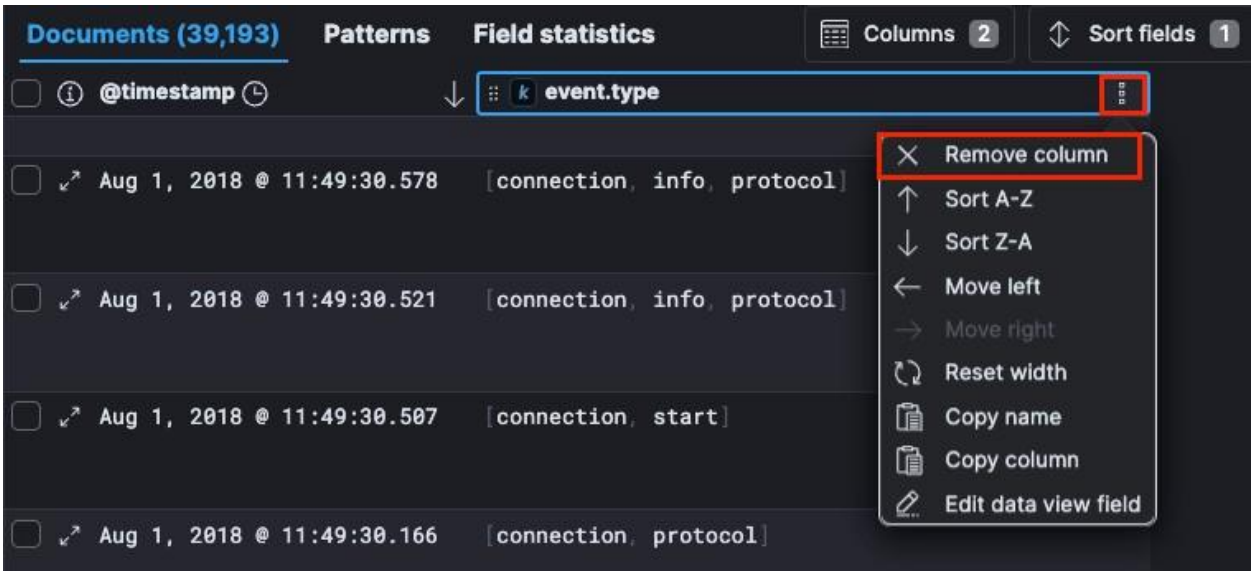

5-2. Hover over the **Value** column menu and choose the **Toggle column in table** option for a different field to view it as a column in the table.

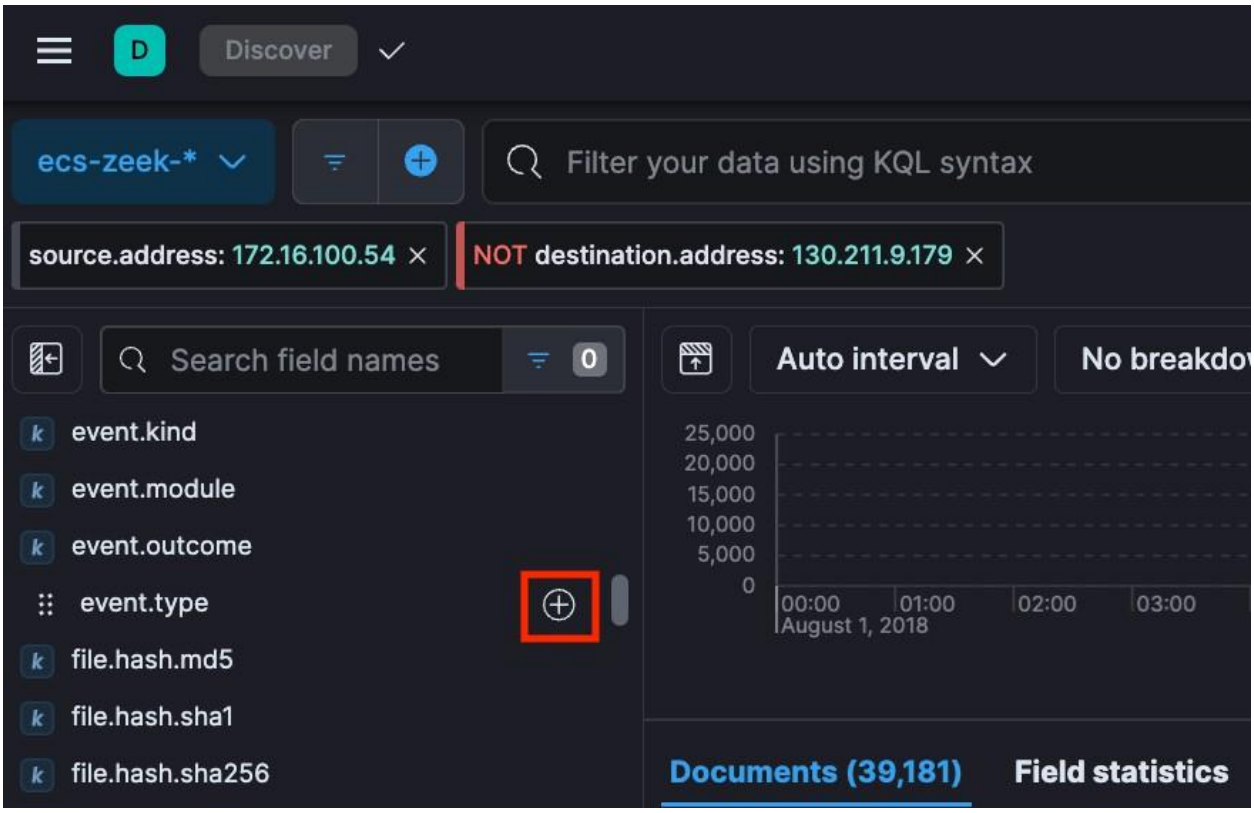

5-3. You will see that the new column has been added to the results table. Adjust the size of your columns, if needed, by dragging the edges of each column.

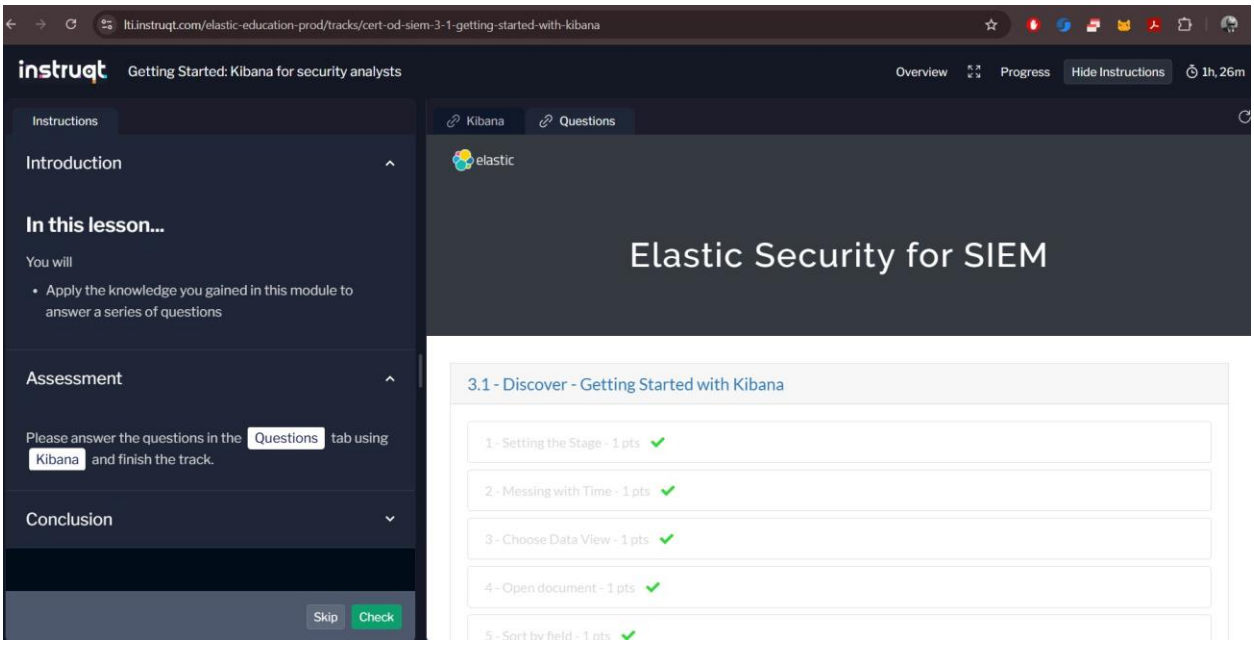

5-4. Click on the three dots next to the field name. A popup menu will give you options for sorting by the field, moving the field, and removing the field, as well as some column-specific options such as copying the field name or value to the clipboard. Select the **X** to remove this column.

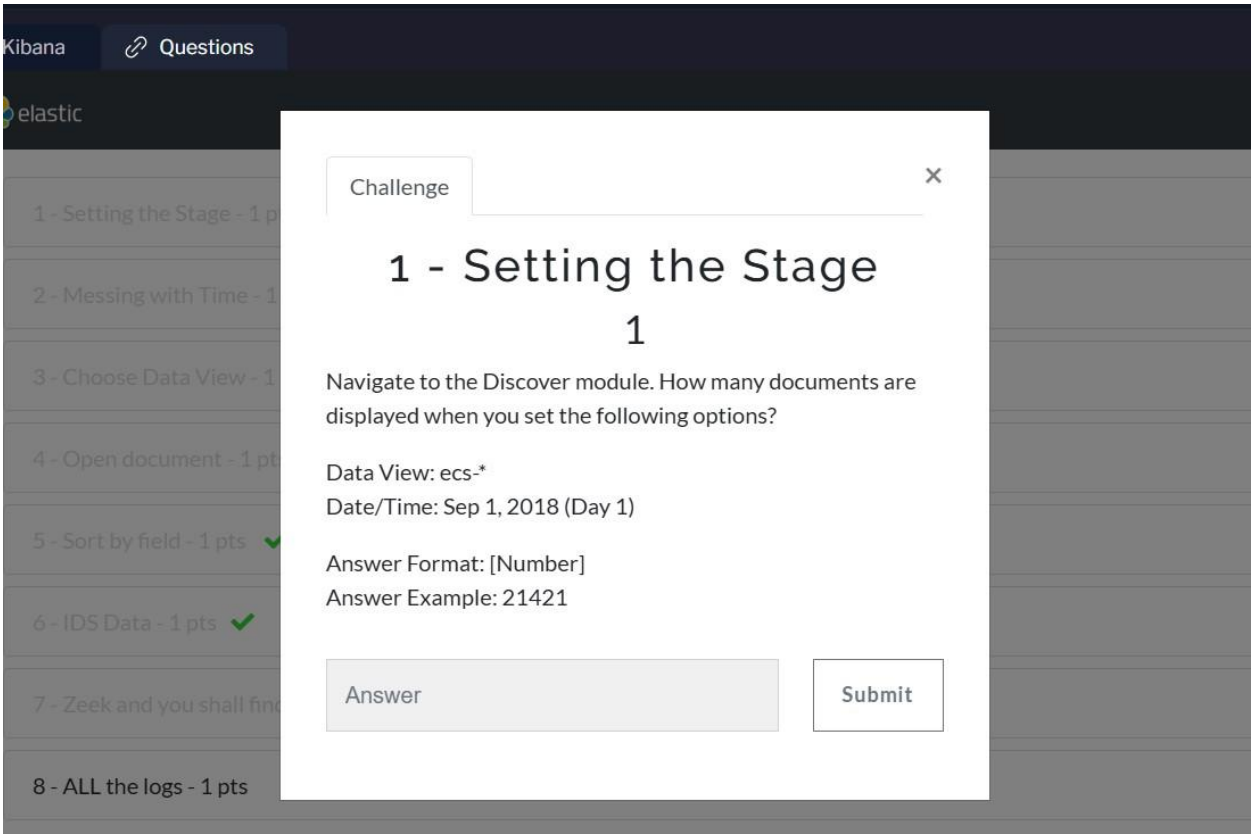

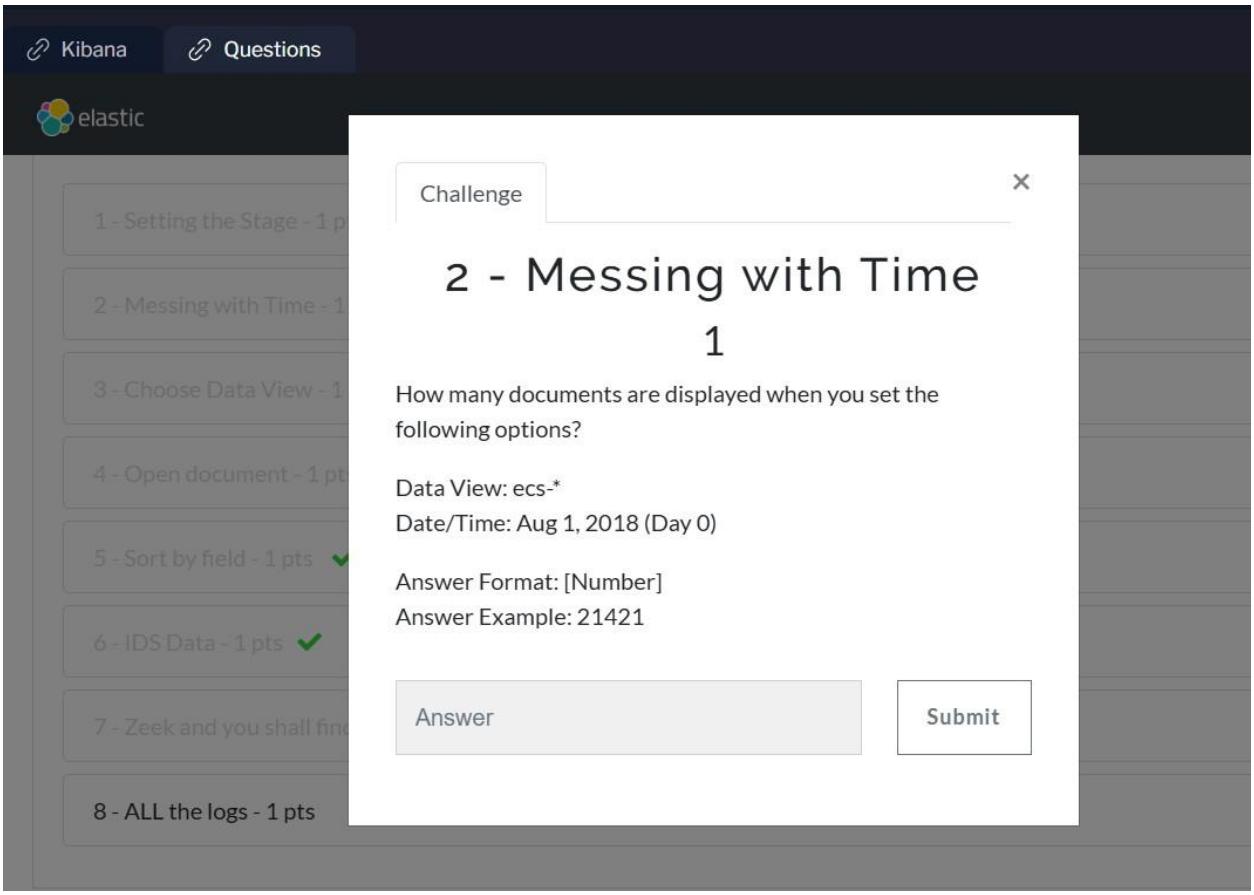

You can also add columns to the view by hovering over a field in the **Available Fields** list and selecting the plus sign (**+**).

6 - IDS Data - 1 pts
7 - Zeek and you shall find
8 - ALL the logs - 1 pts
Challenge
1 - Setting the Stage
1
Navigate to the Discover module. How many documents are displayed when you set the following options?
Data View: ecs-*
Date/Time: Sep 1, 2018 (Day 1)
Answer Format: [Number]
Answer Example: 21421
Answer
Submit

3 - Choose Data View
1
How many documents are displayed when you set the following options?
Data View: ecs-zeek-*
Date/Time: Aug 1, 2018 (Day 0)
Answer Format: [Number]
Answer Example: 21421
Answer
Submit

Challenge
4 - Open document
1
Sort the timestamp Old to New and expand the first document, what is the value for the _id field?
Answer Format: [ID string]
Answer Example: 4Hj2K6ds3ED
Answer
Submit

Challenge
5 - Sort by field
1
While keeping the date/data view from the last question, what time did the first document/record get logged at?
Answer Format: HH:MM:SS
Answer Example: 15:45:12
Answer
Submit

Challenge
6 - IDS Data
1
What data view would you select to limit the results to only Suricata logs?
Answer Format: [Data View]
Answer Example: ecs-windows-*
Answer
Submit

Challenge
7 - Zeek and you shall find
1
What data view would you select to limit the results to only Zeek logs?
Answer Format: [Data View]
Answer Example: ecs-windows-*
Answer
Submit
